

## Level 2 Resurfacing

**Before**

Level 2: Laser Peel (BBL + Sellas)

**After**

Level 2 resurfacing is suited for a dramatic complexion boost for fair to medium skin types (Fitzpatrick Skin Types 1–4). The Broad-Band Light (BBL) is a medical-grade IPL that can effectively reverse sun-induced freckles, pigment blemishes and broken capillaries that characterises sun-damage. The Sellas fractional laser is incorporated to further improve skin texture and radiance. Please refer to the patient information on the lasers specified by your dermatologist.

Level 2 resurfacing does not ablate the skin and has the advantage of minimal recovery time (downtime). After the procedure, the pigment spots will darken and appear more noticeable over the next 7–10 days. However there will be no bleeding or oozing and you can apply sunscreen or camouflage/makeup the next day. Please refer to the post-procedure sheet for detailed instructions on post-laser care.

The treated skin may be slightly red and puffy for the first couple of days (usually not noticed by others). The gentle Sellas resurfacing will produce a slight sand-paper feel as the invisible micro-columns of laser-treated skin begins to exfoliate over days 2–4. The exfoliation is subtle and usually not noticed by others. The treated skin may appear slightly tanned during days 2–4. Most patients do not need to take any time off work. The face will feel nice and smooth by day 5 and look radiant and clear by day 10. This is the laser peel of choice for instant skin rejuvenation with minimal recovery time.

Patients typically undergo 3 treatment sessions in the first 12 months and continue with maintenance treatment every 12–18 months to optimise skin complexion and radiance.
