

Level 4 Resurfacing

Before

Level 4: Laser Peel (BBL + MLP + PF)

Level 4 resurfacing is a 5-day recovery peel that is suited for early textural damage from sun exposure and aging. Textural changes can be seen earliest around the eyes – usually age mid-30s upwards. Fillers and botox correction is only of marginal benefit in the lower eyelid area. This group of patients may benefit from level 4 resurfacing of the face with particular emphasis on the upper and lower eyelids.

Level 4 resurfacing uses the MicroLaser Peel technology, which is a modern gentler version of the traditional full resurfacing (level 7 peel). The MicroLasePeel is a superficial laser peel that will heal in 5 days. It is suited for mild-moderate sun-damage with early textural lines and wrinkles. This level of resurfacing is indicated for early signs of skin aging and when started early enough and, as part of a coordinated long-term protocol, should significantly slow down the aging process.

The procedure is combined with state-of-the-art Broad Band Light and Profractional resurfacing. The recovery period is 5 days and the procedure is safe and effective. There may be spot bleeding immediately post-procedure which settles by the time you leave the clinic. The laser-treated skin will take on a slightly bronzed appearance, which indicates skin renewal. Please refer to the patient information on the lasers specified by your dermatologist. You will be given a post-procedure sheet with detailed instructions on post-laser care.
