

## Level 5 Resurfacing

**Before**

Level 5: Laser Peel (BBL + sCO2)

**After**

Level 5 resurfacing incorporates broadband light with fractional CO2. CO2 resurfacing has experienced a renaissance since 2008 when the fractional mode was first introduced. The unique feature of the Lumenis fractional CO2 is the proprietary active mode setting that combines outstanding coverage (up to 60% of the skin) with sophisticated engineering to ensure optimum safety and results using ultrapulse technology.

Level 5 resurfacing is ideal for sun-damaged complexion and is effective against irregular pigmentation and fine lines and wrinkles especially around the eyes. A one-off botulinum treatment around the eyes may be recommended to stop excessive expression lines forming during the 2–3 months post-laser recovery period.

The recovery time for level 5 resurfacing is around 5–7 days. The skin initially looks spotty (white) after the laser treatment. This gradually darkens (bronzing) over the next 2–5 days. 80% of patients will heal by day 5 with the remainder fully healed by day 7.

Please refer to the patient information on the lasers specified by your dermatologist. Up to 3 treatment sessions every 3–4 months may be needed for more severe forms of photodamage and aging. Please also refer to the post-procedure instruction sheet for detailed post-laser care.
